

GRID

MAPPING THE FUTURE OF
PRINTING.

the **vision.**

"To be the essential **digital printing partner in the global market**, making the transition from digital design to physical reality effortless and stress-free for every user."

the **mission.**

"To **revolutionize the printing experience** by combining precision technology, high - quality output, and seamless logistics, empowering professionals and students to focus on their craft."

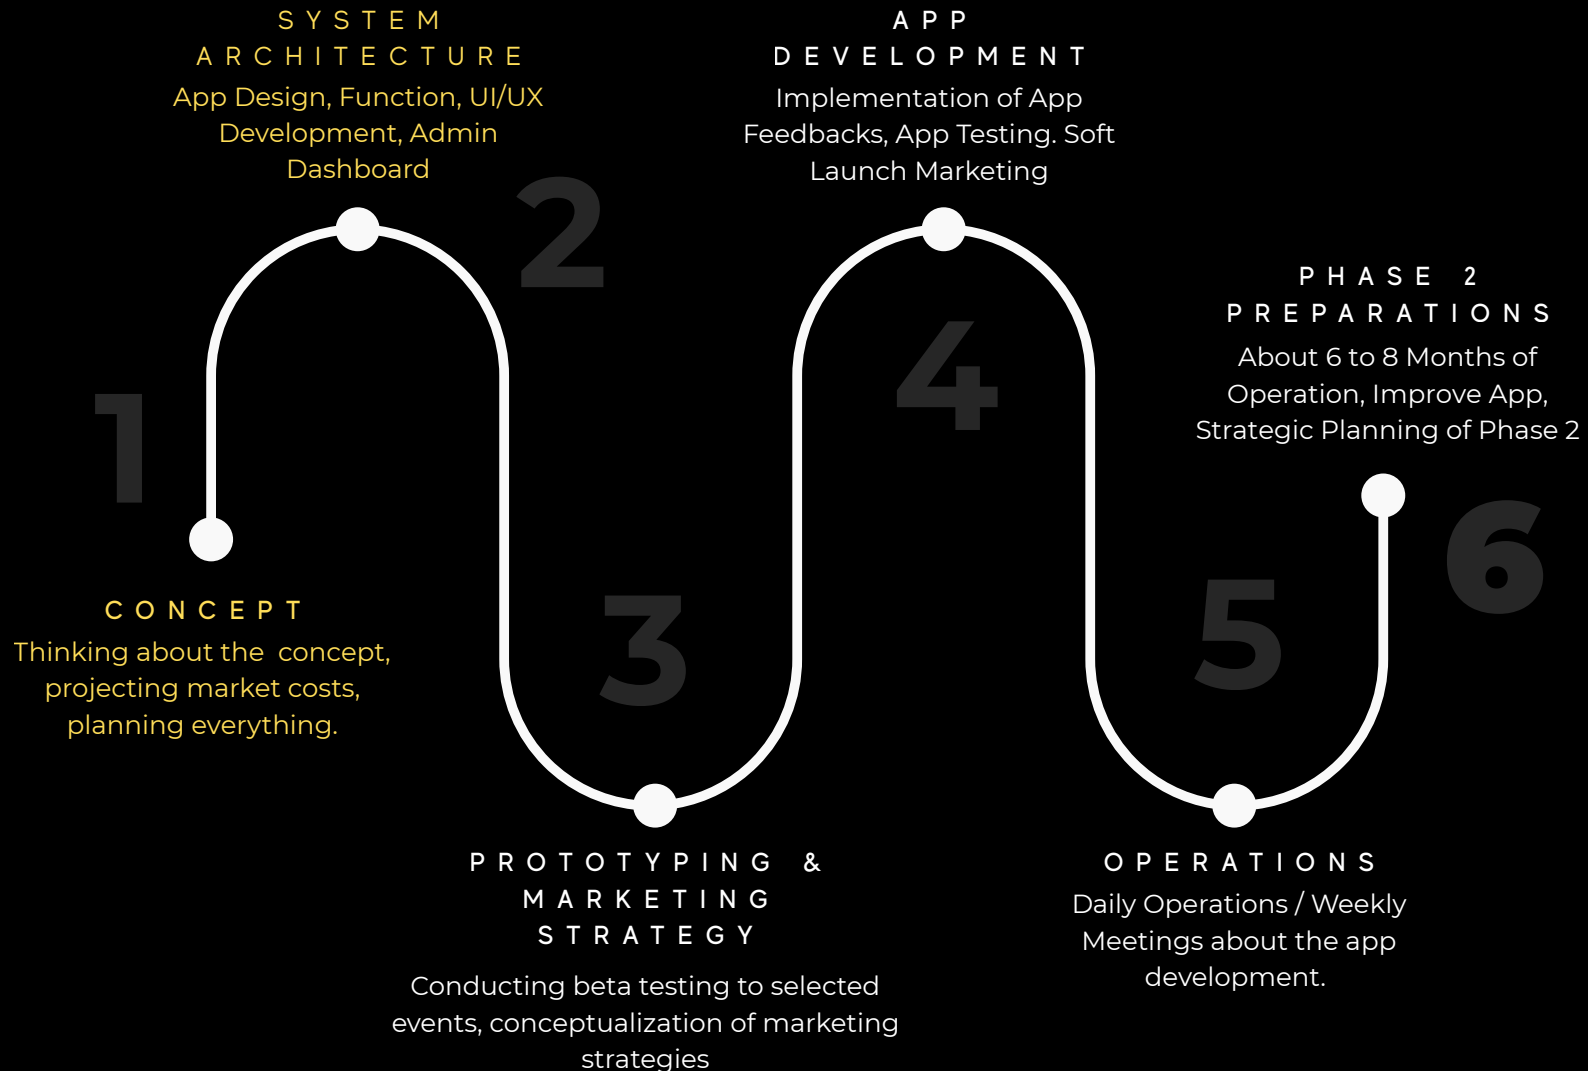

the **goal.**

"To become and lead the digital printing industry within the Philippine market in the span of **three to five years.**"

PHASE 1

STRATEGIC ROAD MAP

THIS WILL GUIDE US IN OUR DEVELOPMENT

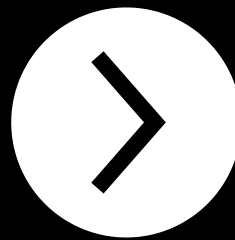

the
admin change.

the admin change.

Financial / Operational Tracker
All Around Admin

Operational Engine
Output Based

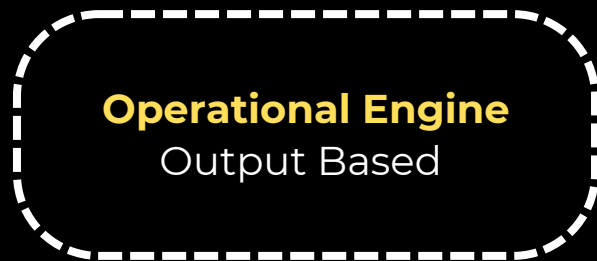

I am planning to make an accounting department which will handle all the financials and I want you developers to focus on how to improve the app only and our future developments.

the admin change.

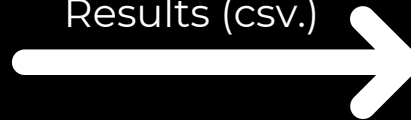

W H Y ?

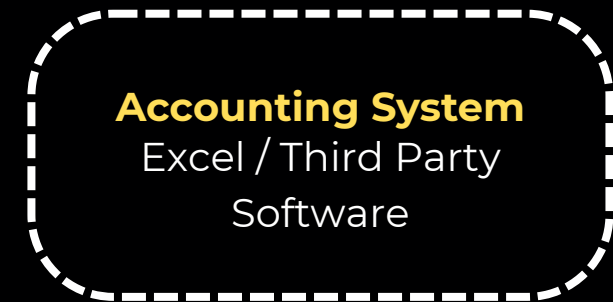

DEVELOPERS / ADMIN

Results (csv.)

ADMIN USE ONLY

I want the GRID dashboard to be a pure 'Operational Engine.' We are going to treat accounting as a separate workload for a different department. For now, the app's job is just to output raw operational data (units, distances, counts). I will handle the financial 'translation' layer myself in a separate system to avoid overcomplicating your codebase.

the admin change.

Operational Engine

I. Order & Production Management

- Job Pipeline: Status tracking (Queued, Printing, Ready, Out for Delivery).
- File Inspector: Previewer for PDFs and CAD exports with page-count validation.
- Priority Toggle: Ability to move "Express" jobs to the top of the queue.

II. Logistics & Fleet (Phase 1 Focus)

- Rider Live-View: Real-time GPS tracking of active deliveries in Davao.
- Live Map: This is for tracking the customers and the rotating riders.
- Dispatch Logic: Auto-assigning jobs to the nearest available rider.
- Proof of Delivery (PoD): Mandatory photo upload or digital signature upon delivery.

III. Hardware & Network (Phase 2 & 3 Readiness)

- Node Health Dashboard: Monitoring paper levels, toner, and connectivity for remote units.
- Remote Command Console: Ability to restart software or clear print queues remotely.

IV. System Efficiency (Non-Financial KPIs)

- Turnaround Time (TAT): Time from "Order Placed" to "Order Delivered."
- Error Rate: Frequency of failed prints or rejected deliveries.
- User Retention Heatmap: Tracking how often a single User ID returns to the app.

V. Security & Data Protection

- Role-Based Access (RBAC): Developers get "Debug" access; Managers get "Operational" access; only the Owner gets "Export" access.
- The "Master CSV" Export: A one-button tool that exports all raw operational data to be used for Excel/Accounting software.

DONE

the

GRID Credit System.

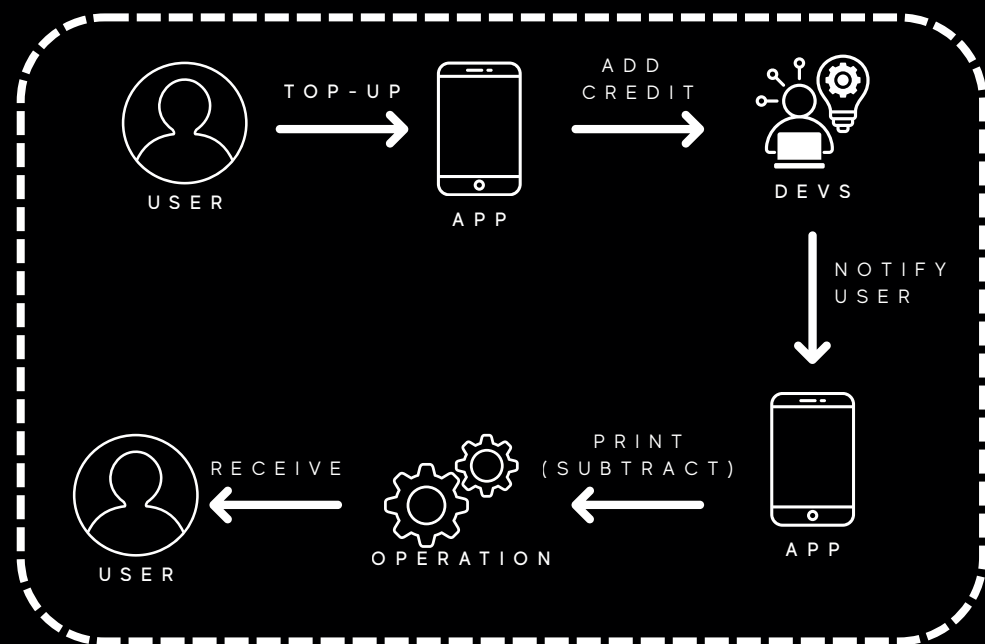

the **GRID Credit System.**

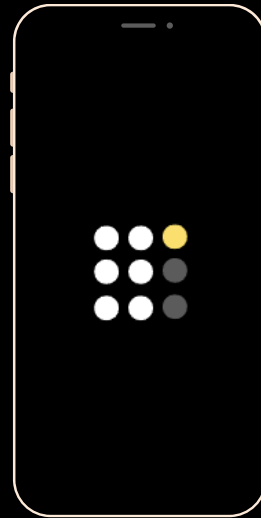

TENTATIVE COIN DESIGN

CREDIT SYSTEM

The credit system still has a tentative design and simple workflow, I'd like us to discuss this in our next meeting regarding major changes on the systems.

THANK YOU

SEE YOU SOON!
